A1. Demonstrate and Create project in local and remote repository using GitBash and GitHub and apply `init`, `status`, `log`, `add`, `commit`, `push`, `config`, `clone` and `reset` commands on repository.

Git **init** command:

Description;

`init` is the Git command that allows you to create a local repository. This command creates a `.git` directory that contains all of the folders and configuration files of the local repository.

Syntax :`git init`

Example :`git init`

Git **status** command:

Description:

The status command is used to display the state of the working directory and the staging area. It also lists the files that you've changed and those you still need to add or commit.

Syntax :`git status`

Example :`git status`

Git **log** command:

Description:

This command is used to check the commit history.

Syntax :`git log`

Example :`git log`

Git **add** command:

Description:

Making a commit (which we will see next) is to archive our changes in our local repository. When we edit files, we can choose which ones will be included in the next commit; it's a staged concept. The other files not selected will be set aside for a later commit.

Syntax :`git add <files path to add>`

Example :`git add main.py`

Git **commit** command:

Description:

A commit is a Git entity that contains a list of changes made to files and that have been registered in the local repository. Making a commit, therefore, consists of archiving changes made to files that have been previously selected with the add command.

Syntax :git commit -m "<your commit message>"

Example :git commit -m "first commit"

Git **push** command:

Description:

When we make commits, they are stored in the local repository, and when we are ready to share them with the rest of the team for validation or deployment, we must publish them to the remote repository. To update a remote repository from commits made on a local repository, we use this command.

Syntax :git push <alias> <branch>

Example :git push origin master

Git **config** command:

Description:

Git configuration requires us to configure our username and email,

Syntax :

git config --global user.name "<your username>"

git config --global user.email "<your email>"

Example :

git config --global user.name "nagesh-s"

git config --global user.email "nagesh-s@gmail.com"

Git **clone** command:

Description:

This command is used to make a copy of a repository from an existing URL. If I want a local copy of my repository from GitHub, this command allows creating a local copy of that repository on your local directory from the repository URL.

Syntax :git clone URL

Example :git clone https://github.com/nagesh-s-03/Jenkins_JAVA.git

Git **Reset** command:

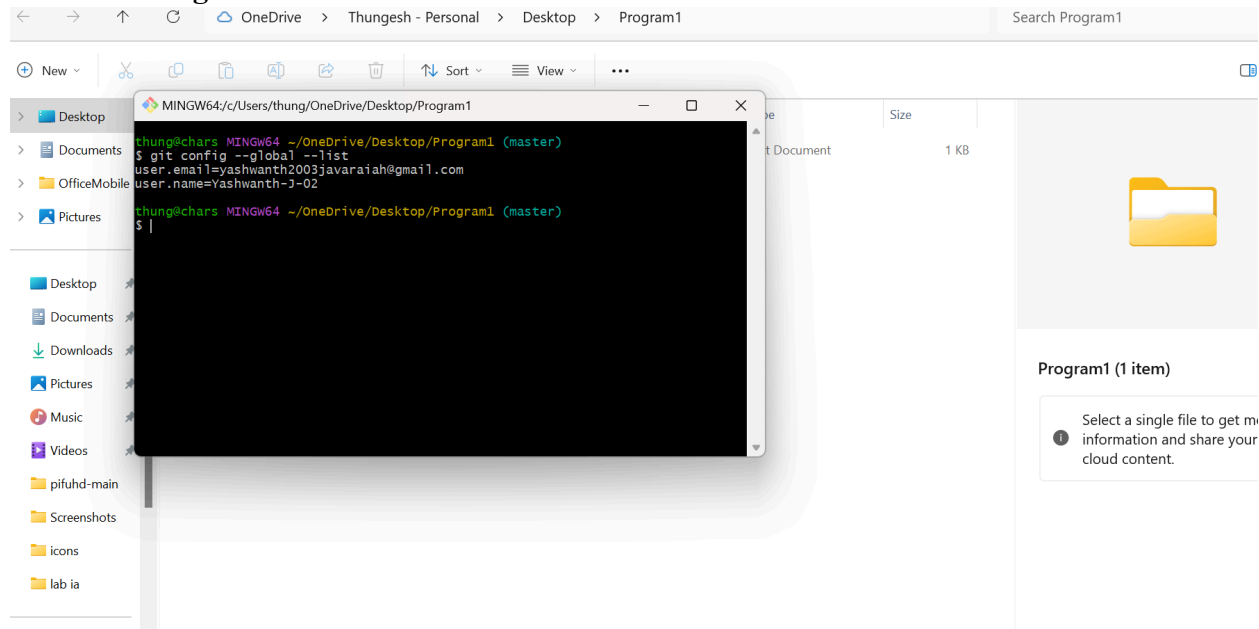

Description:

The term reset stands for undoing changes. The git reset command is used to reset the changes.

Syntax : git reset --hard <id>

Example :git reset --hard 6567b5e3e06421edf403e6bded67732563ef0985

Git user configuration details

Configuration	Execution	Viva	Total	Verified By

A2. Demonstrate to create a project in remote repository and apply fork, merge, diff, merge conflict, branch and pull request concepts on repository using GitHub

Git **fork** command:

Description:

A fork is a rough copy of a repository. Forking a repository allows you to freely test and debug with changes without affecting the original project.

It is a straight-forward process. Steps for forking the repository are as follows:

- o Login to the GitHub account.
- o Find the GitHub repository which you want to fork.
- o Click the Fork button on the upper right side of the repository's page.

Git **merge** command:

Description:

By default, when creating a repository, the code is placed in the main branch called master. In order to be able to isolate the developments of the master branch—for example, to develop a new feature, fix a bug, or even make technical experiments—we can create new branches from other branches and merge them together when we want to merge their code.

Syntax :git merge <branch name>

Example :git merge testing

Git **diff** command:

Description:

It compares the different versions of data sources. The version control system stands for working with a modified version of files. So, the diff command is a useful tool for working with Git.

Syntax :git diff <branch name>

Example :git diff master

Git **branch** command:

Description

A branch is a version of the repository that diverges from the main working project. It is a

feature available in most modern version control systems. A Git project can have more than one branch. You can create a new branch with the help of the `git branch` command. This command will be used.

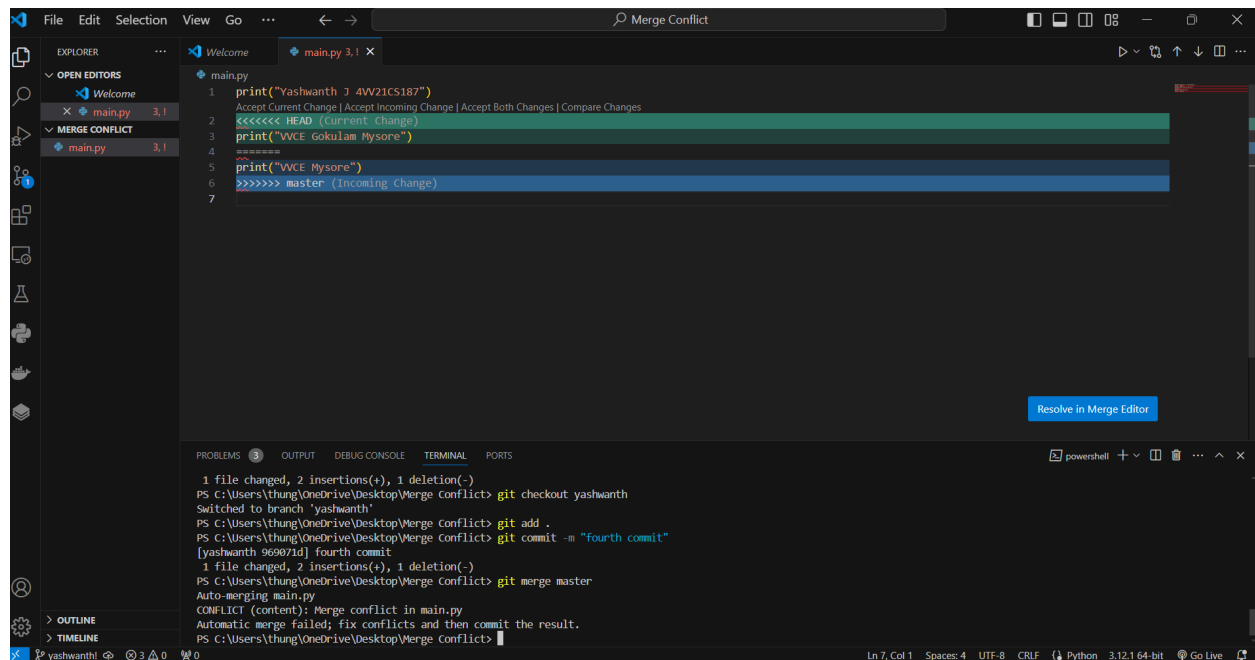

Syntax : `git branch <branch name>`

Example : `git branch testing`

Git merge conflict demonstration :

Description:

When two branches are trying to merge, and both are edited at the same time and in the same file, Git won't be able to identify which version is to take for changes. Such a situation is called merge conflict.

```
1 print("Yashwanth 3 4V21CS187")
2 <<<<<< HEAD (Current Change)
3 print("VVCE Gokulam Mysore")
4
5 print("VVCE Mysore")
6 >>>>>> master (Incoming Change)
7
```

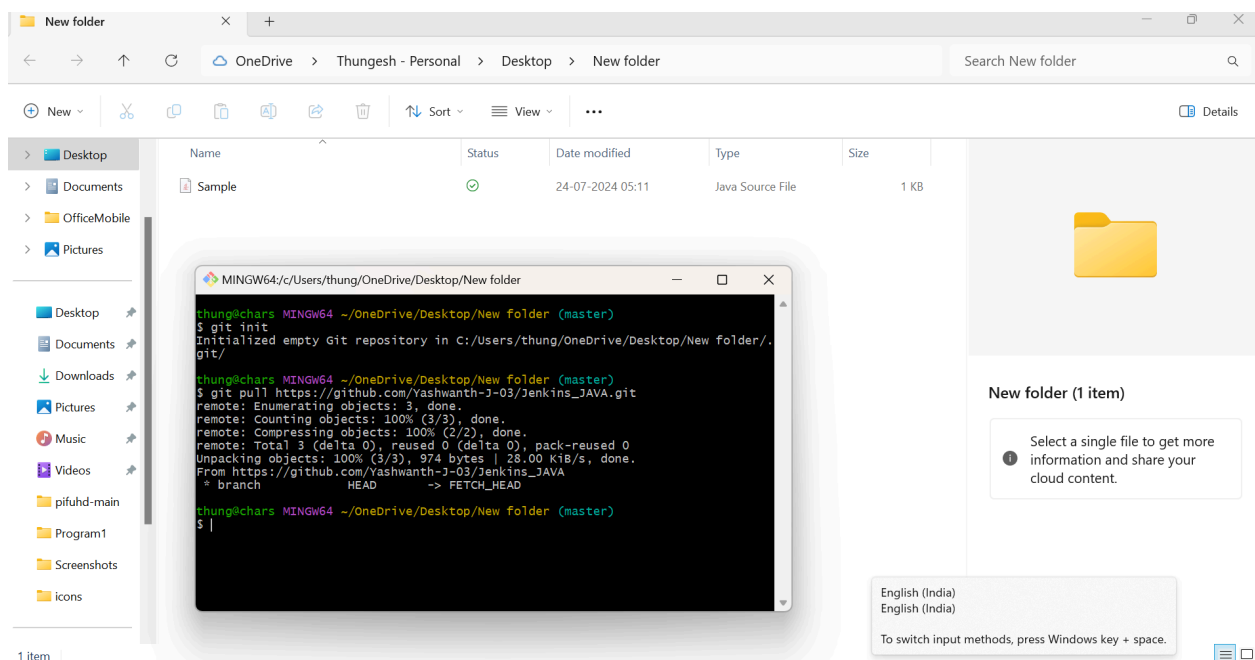

```
1 file changed, 2 insertions(+), 1 deletion(-)
PS C:\Users\thung\OneDrive\Desktop\Merge Conflict> git checkout yashwanth
Switched to branch 'yashwanth'
PS C:\Users\thung\OneDrive\Desktop\Merge Conflict> git add .
PS C:\Users\thung\OneDrive\Desktop\Merge Conflict> git commit -m "fourth commit"
[yashwanth 969071d] fourth commit
1 file changed, 2 insertions(+), 1 deletion(-)
PS C:\Users\thung\OneDrive\Desktop\Merge Conflict> git merge master
Auto-merging main.py
CONFLICT (content): Merge conflict in main.py
Automatic merge failed; fix conflicts and then commit the result.
PS C:\Users\thung\OneDrive\Desktop\Merge Conflict>
```

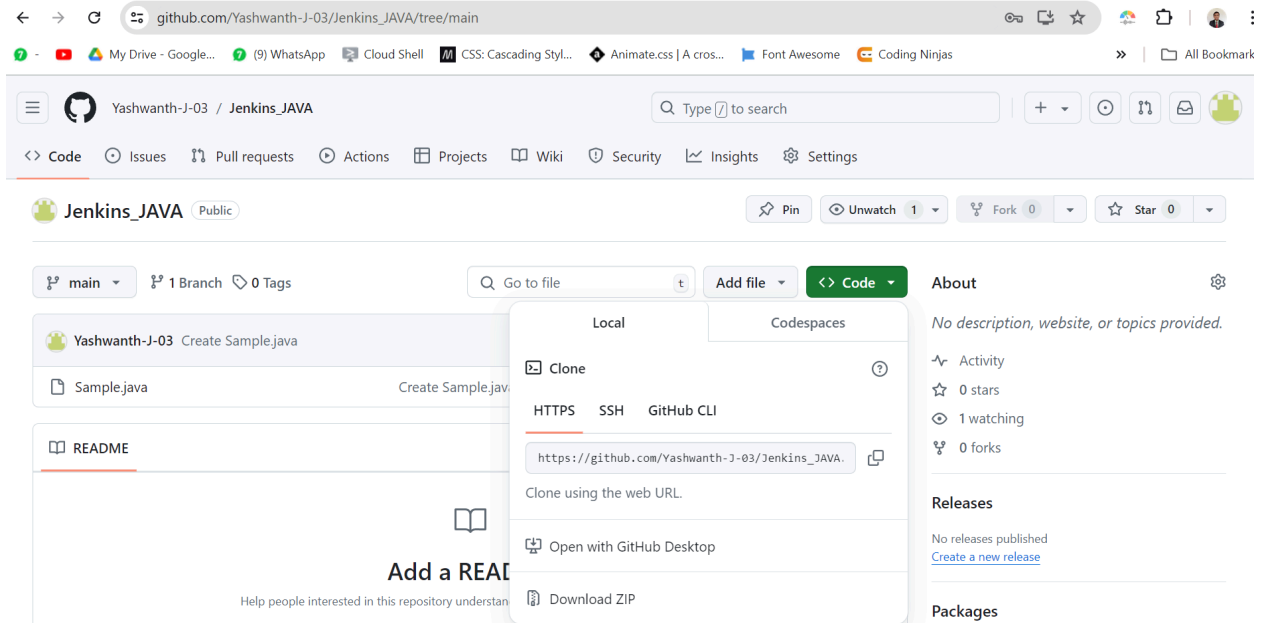

Create **pull request** demonstration:

Description:

The term pull is used to receive data from GitHub. It fetches and merges changes from the remote server to your working directory. The git pull command is used to pull a repository.

Example :

Configuration	Execution	Viva	Total	Verified By

A3. Demonstrate the process of integration github repository with Jenkins to automate the project execution in CI/CD pipeline.

Git Hub

Source code :

```
class Sample
{
    public static void main(String[] args)
    {
        System.out.println("nagesh-s");
        System.out.println("4vv21cs103");
    }
}
```

Configuration	Execution	Viva	Total	Verified By

B1. Create a docker image for an application stored in local repository and run the application using docker image.

Application Source code

```
class Sample
{
    public static void main(String[] args)
    {
        System.out.println("nagesh-s");
        System.out.println("4vv21cs103");
    }
}
```

Dockerfile:

```
FROM openjdk
WORKDIR /app
COPY . /app
RUN javac Sample.java
CMD ["java","Sample"]
```

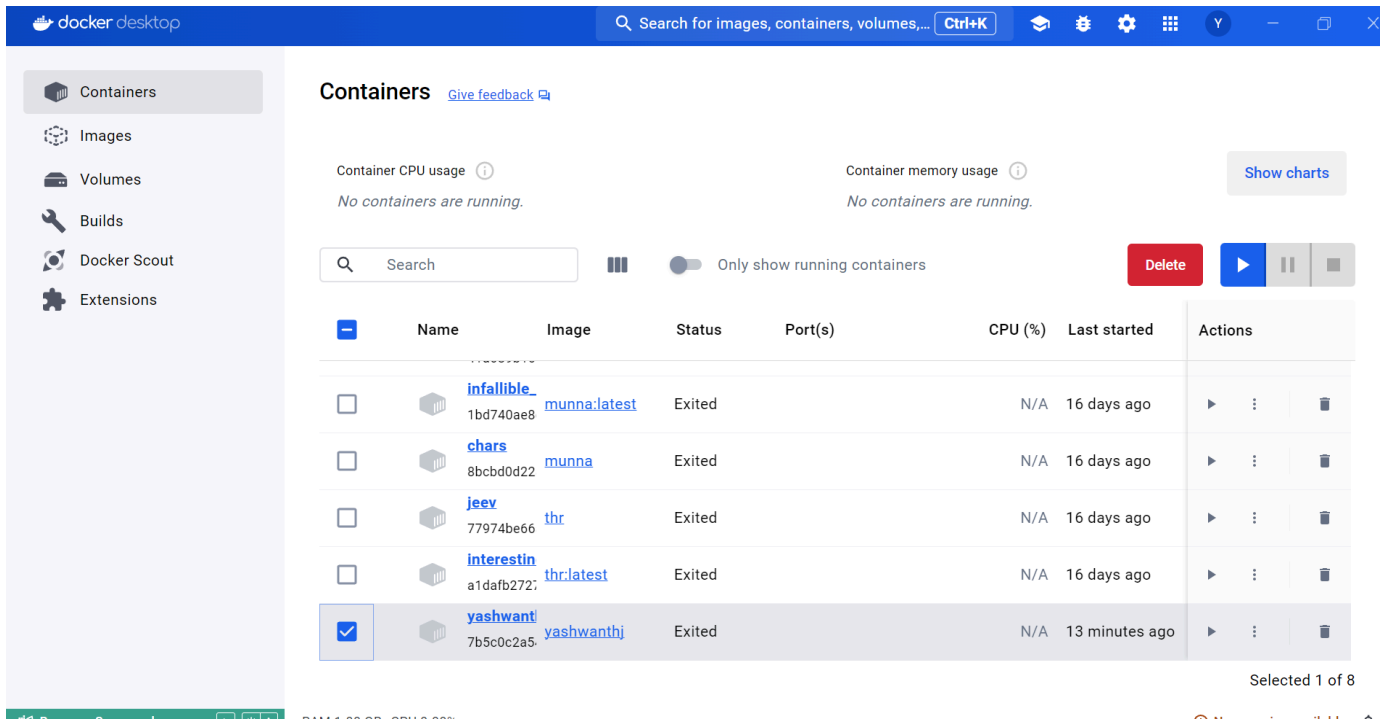

Command to Build image: docker build -t <name of image> .

docker build -t javaapp.

Command to run the image: docker run --name <container name> <name of image>

Docker run --name javaapp javaapp

Docker container

Configuration	Execution	Viva	Total	Verified By

B2. Create and configure Jenkins files for workflow and build of an application and push the image

Application Source code:

```
class Sample
{
    public static void main(String[] args)
    {
        System.out.println("nagesh-s");
        System.out.println("4vv21cs103");
    }
}
```

Dockerfile

```
FROM openjdk
WORKDIR /app
COPY . /app
RUN javac Sample.java
CMD ["java", "Sample"]
```

Command to Build image: `docker build -t <name of image> .`

`docker build -t nagesh-s .`

Command to tag the image :

`docker tag <Image id> <dockerhub login>/<name of image>:v1`

`docker tag 6e87198b9dfe nagesh-s/nagesh-s:v1`

Command to push the image : `docker push docker.io/<dockerhub login>/<name of image>:v1`

`docker push docker.io/nagesh-s/nagesh-s:v1`

C1. Create a maven projects with all dependencies required for the application in CI/CD pipeline.

Maven Dependency:

```
<!-- https://mvnrepository.com/artifact/com.googlecode.json-simple/json-simple -->
<dependency>
  <groupId>com.googlecode.json-simple</groupId>
  <artifactId>json-simple</artifactId>
  <version>1.1.1</version>
</dependency>
```

JSON data:

```
{"firstname": "nagesh-s",
"lastname": "4vv21cs103"}
```

Java Program to read data from JSON file

```
package nagesh-s_4vv21cs103.nagesh-s_4vv21cs103;

import java.io.FileReader;
import java.io.IOException;
import java.text.ParseException;
import org.json.simple.JSONObject;
import org.json.simple.parser.JSONParser;

public class ReadJson {

    public static void main(String[] args) throws IOException,
    ParseException, org.json.simple.parser.ParseException{

        JSONParser jsonparser = new JSONParser();

        FileReader reader = new FileReader(".\\JSON\\student.json");

        Object obj = jsonparser.parse(reader);

        JSONObject studentobj =(JSONObject)obj;

        String fname = (String)studentobj.get("firstname");

        String lname = (String)studentobj.get("lastname");
```

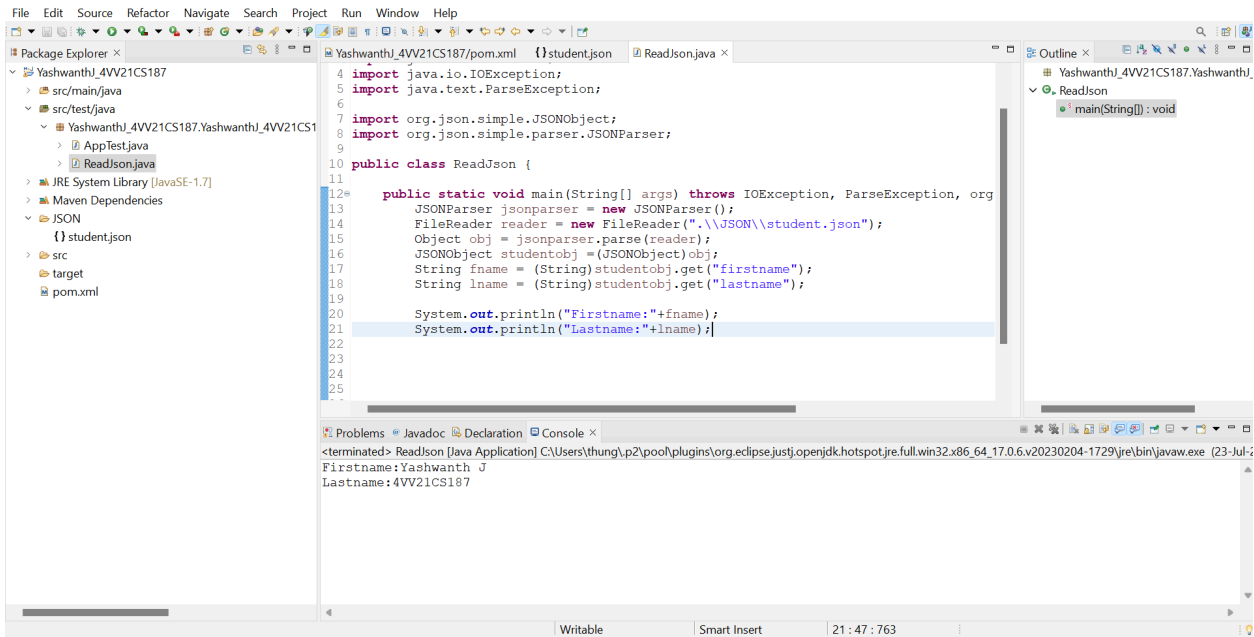

```
System.out.println("Firstname:"+fname);

System.out.println("Lastname:"+lname);
```

```
}

}
```

Program output:

Configuration	Execution	Viva	Total	Verified By

C2. Integrate communication channel with Jenkins for status of project and also enable email notification for a build.

Slack Group Name : vvcegroup

Slack Channel Name : #devops-demo

Slack plugins:Slack notification plugin

Steps to get secret text :

1. Goto Manage Jenkins
2. Goto plugins
3. Click on Slack Notification plugin
4. Goto <https://my.slack.com/services/new/jenkins-ci>
5. Select the channel
6. You will get secret key

Secret Text : `jg3sifiR9GkRCESPaLE8gewX`

Name of the project :nagesh-s_4vv21cs103

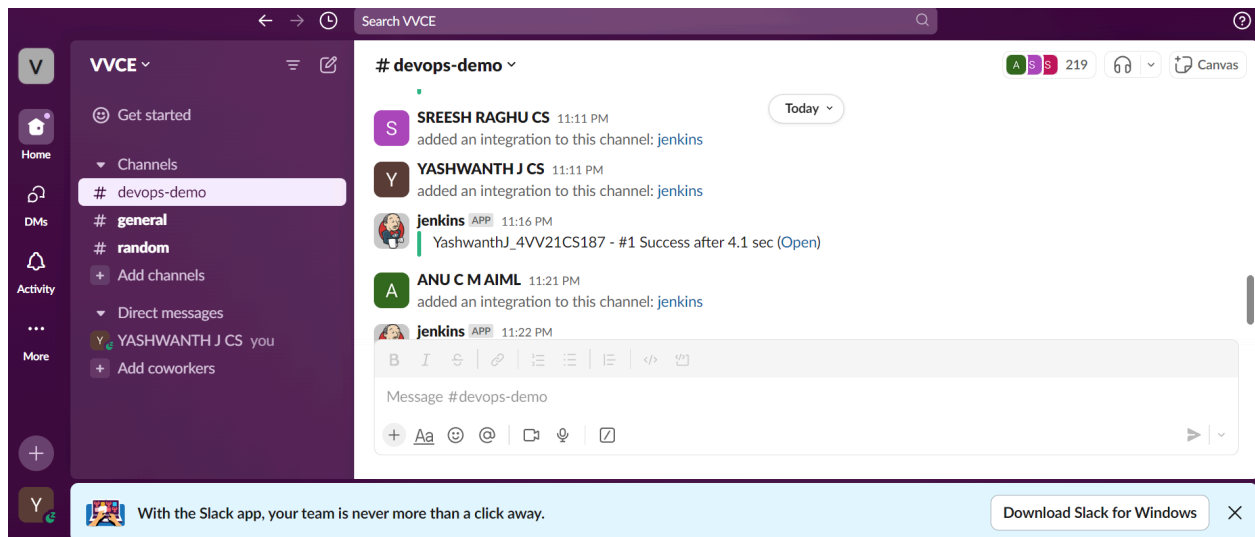

Windows Execution batch command: java -version

Enabled Post build actions:
